White Paper Series

Hybrid Scaffolding Improves Genome Assembly Accuracy and Contiguity

Next-Generation Mapping Reveals True Long Range Structure of the Genome and Reduces Sequencing Costs

Generating high-quality finished genomes remains challenging. Accurate identification of structural variation with minimal gaps is difficult or impossible using short-read sequencing technologies alone.

The genomes of most higher organisms are highly repetitive. Two thirds of human and most mammalian genomes consist of repeats, and many plant genomes have even higher repeat content. Short reads usually fail to span long repeat arrays or disambiguate different copies of interspersed repeats that are not spanned. These failures can limit contig length and introduce chimeric joins and other assembly errors.

The widespread use of next-generation sequencing

Only extremely long molecules, ranging in size from hundreds of thousands to millions of base pairs, provide accurate structure of the genome. Bionano Genomics' Next-Generation Mapping (NGM) visualizes long DNA molecules in their native state. Long range genomic structural information is preserved and directly observed instead of algorithmically inferred as in sequencing approaches. These long labeled molecules are *de novo* assembled into physical maps spanning the whole genome. The resulting order and orientation of sequence elements in the map can be used for anchoring NGS contigs and detecting structural variation.

Conclusions

- **Bionano genome maps show the true structure of the genome**
- **Large structural variants and rearrangements are detected with much higher sensitivity than using sequence based methods**
- **Combining NGS and Bionano NGM data produces assemblies of the highest quality**
- **Bionano hybrid scaffolding is agnostic to the sequence technology used**
- **Bionano is the ONLY non-sequencing based scaffolding technology capable of correcting sequencing-type errors**
- **Including Bionano mapping data into *de novo* genome assemblies has become a *de facto* standard**

Thank you
